

The annual summer school on space technologies has started at the Polytechnic University

The international summer school "[Space Technologies](#)" is organized by our institute and has been held at the Polytechnic University for the 6th year in a row.

This year, as always, the school includes many lectures and practical classes on four main tracks: Cosmology, Telecommunications in the space industry, Engineering for the space industry and a practical track on the development of a nanosatellite.

For some students, participation in school is the first step towards a future profession, for others it is just a very interesting and informative two weeks.

In any case, we hope that the coming days will be interesting and will be remembered by our students in the most positive light.
